

Build a full-stack cross-platform application (Mobile + Web) for a “Women Safety Band” system

The application must work as:

- A mobile app (Android/iOS)
- A web app (browser-based dashboard)
- Responsive design for both phone and desktop

SYSTEM OVERVIEW

This is a cloud-connected emergency safety system where a wearable band triggers alerts, and the app handles monitoring, tracking, and response.

IMPORTANT:

- Do NOT use Bluetooth
 - Assume the wearable device connects directly to the cloud via LTE/eSIM
 - Simulate device trigger using an in-app panic button
-

CORE FEATURES

1. AUTHENTICATION

- Phone number login (OTP-based)
 - User profile setup
-

2. HOME DASHBOARD

- Large red “PANIC BUTTON” centered on screen
 - Device status:
 - Battery (simulated)
 - Network connectivity
 - Quick access to contacts and history
-

3. PANIC ACTIVATION FLOW

When panic button is pressed:

- Fetch real-time GPS location
 - Activate camera preview
 - Mark emergency as ACTIVE
 - Send alert event to backend
 - Navigate to Emergency Screen
-

4. EMERGENCY SCREEN

- Show:
 - Live GPS location on map (Google Maps or equivalent)
 - Live camera preview
 - Status text: "Emergency Active" / "Alert Sent"
 - Continuously update location
 - Show timer (incident duration)
-

5. CONTACT MANAGEMENT

- Add/remove trusted contacts
 - Store:
 - Name
 - Phone number
 - Toggle alert type:
 - SMS
 - Call
 - App notification
-

6. ALERT SYSTEM

- Simulate sending alerts:
 - Push notification
 - Optional SMS API
 - Store alert data in database
-

7. INCIDENT HISTORY

- Store all emergency events
 - Each record includes:
 - Timestamp
 - Location (latitude/longitude)
 - Status
 - Display as list with details view
-

8. WEB DASHBOARD

- Responsive admin/user dashboard accessible via browser
 - Features:
 - View live active emergencies
 - View user's past incidents
 - Map view of incidents
 - Basic analytics (number of alerts)
-

9. BACKEND REQUIREMENTS

- Use Firebase / Supabase / Node.js backend

- Database collections:
 - Users
 - Contacts
 - Alerts/Incidents
 - Real-time updates (WebSockets or Firebase real-time)
-

10. UI/UX DESIGN

- Dark theme
 - Primary color: Red (#D33) for emergency actions
 - Minimal, fast, and high-contrast design
 - Large buttons for quick access
 - Fully responsive (mobile + desktop)
-

11. TECH STACK

- Frontend:
 - Flutter (for mobile + web) OR React + Next.js
 - Backend:
 - Firebase / Supabase
 - Maps:
 - Google Maps API
 - Camera:
 - Device camera integration
-

12. ADDITIONAL FEATURES

- Real-time location updates every 2–3 seconds
- Countdown timer during emergency
- “End Emergency” button
- Simple analytics dashboard (web)

13. GOAL

Create a fully functional prototype that:

- Works on mobile and desktop
 - Demonstrates panic → alert → tracking flow
 - Can be extended into a production-ready system
-

14. OUTPUT REQUIRED:

- Working app (mobile + web)
 - Clean UI
 - Functional panic system simulation
 - Real-time tracking demo
-
